

Evacuation Cot

Incubators and cots are cumbersome to transport and virtually impossible to carry downstairs.

The only alternative has been to remove the babies - leaving them vulnerable, or hope that an evacuation downstairs will not become necessary - would you want to rely on hope in an emergency?

- Safe evacuation of premature and new born babies
- Will carry up to 3 babies, depending on size & condition
- Secure storage for a small oxygen cylinder
- Adjustable shoulder straps
- Flexible, strong construction allows easy handling

Vacuum Mattress

The Paraid Medical vacuum mattress is a medical device used for the immobilisation of patients, especially in the case of vertebra, pelvis or limb trauma.

The mattress consists of a sealed polymer bag (larger than the human body) that encloses small polystyrene balls. When the mattress is under pressure, the balls are free and mould themselves around the patient, air is pumped out through the valve and the valve closed. The atmospheric pressure presses the balls together and the mattress becomes rigid securing the patient.

- Available in adult and paediatric sizes
- Versatile
- Can be personalised with your logo
- Packs away in to a carry bag
- Supplied with pump
- Fitted with carry handles and patient straps
- Washable
- X-ray translucent
